/note="Vector: pBluescript SK(-); Site 1: EcoRI; Site 2:
XhoI; This library targets genes expressed in dormant tubers. This library was made from sections of dormant tuber, avoiding the buds and epidermis. Tubers were stored for one month post-harvest at 40C. The tuber was peeled, well away from the surface. Then it was chopped into 1-2 mm cubes and immediately frozen in liquid nitrogen. This library is noted as P4 in Tanksley lab notebooks."

Site 2: XhoI; supplier: Developmental series. Callus was
induced from Shepody, Clone 1756, sterile stem sections by
culture on Callus Induction Medium (CIM); comprised of MS
medium (pH 5.6) containing 10 mg/L Thiamine-HCL, 01 mg/L
Kinetin and 3 mg/L 2,4-D solidified with .8% (w/v)
Phytagar. Suspensions were induced by placing callus from
the plates into 125 ml Erlenmeyer flasks with liquid CIM
(no Phytagar) at a density of 10% (w/v) in volumes of
approximately 30-35 ml. Cells were subcultured weekly by
transfer to fresh media, with the density remaining at 10%
(w/v) and the volume remaining around 30 ml. Cells were
collected for RNA isolations and library construction 5
days after subculture."

XhoI, Tissue supplied by Christian Bachem and Richard Visser (Department of Plant Breeding, Wageningen University, The Netherlands); sequencing by The Institute for Genomic Research. The cSTA libraries will attempt to capture the induction and initiation/initial growth of the tuber in an in vitro system as described in Bachem et al. (Plant Journal, 1996). Small microtubers develop from axillary buds attached to stem explants when placed on a high sucrose medium (10%). Visible morphological changes occur synchronously at day five in the axillary buds harvested on days 1-3. This targets those genes involved in induction of the microtubers. The following libraries, cSTA (21-40) and cSTA (41-60), capture genes involved in tuber initiation and outgrowth. This library is noted as P3 in Tanksley lab notebooks."

Site_2: XhoI, supplier: Developmental series. Callus was
side_2: XhoI, supplier: Developmental series. Callus was
induced from Shepody, Clone 1756, sterile stem sections by
culture on Callus Induction Medium (CIM), comprised of MS
medium (pH 5.6) containing 10 mg/L Thiamine-HCL, .01 mg/L
Kinetin and 3 mg/L 2,4-D solidified with .8% (w/v)
Phytagar. Suspensions were induced by placing callus from
the plates into 125 ml Erlenmeyer flasks with liquid CIM
(no Phytagar) at a density of 10% (w/v) in volumes of
approximately 30-35 ml. Cells were subcultured weekly by
transfer to fresh media, with the density remaining at 10%
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      days after subculture."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (w/v) and the volume remaining around 30 ml. Cells were collected for RNA isolations and library construction 5

Ay303170

Ay303170

Solanum bulbocastanum chromosome 8 clone CB3A14, complete sequence.

Ay303170

Ay303170

Ay303170

Ay303170.1 GI:32470628

Solanum bulbocastanum
Solanum bulbocastanum
Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta;
Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots;
asterids; lamids; Solanales; Solanaceae; Solanum.

CE 1 (bases 1 to 79178)

RS Song,J., Bradeen,J.M., Naess,S.K., Raasch,J.A., Wielgus,S.M.,
Haberlach,G.T., Liu,J., Kuang,H., Austin-Phillips,S., Buell,C.R.,
Helgeson,J.P. and Jiang,J.

Gene RB cloned from Solanum bulbocastanum confers broad spectrum
resistance to potato late blight
Proc. Natl. Acad. Sci. U.S.A. 100 (16), 9128-9133 (2003)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  http://genemark.biology_gatech.edu/GeneMark/) and GeneSplicer (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org), searches of the complete sequence against a peptide database and the plant EST database at TIGR (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy,
